## Solenvis SL92 MBUS Reading Software

The software is designed to make meter reading simple for the client. With our easy to manage software, alternative reading intervals can be configured for different meters. The software is not tied to any one manufacturer, the current range of meters supported is extensive and being added to on a regular basis.

The software allows the client to arrange their meters in sites and MBUS loops. The meters can then be automatically read at pre-determined intervals to suit the clients requirements. The readings are stored in an access database and can either be accessed directly or exported as a *.csv file.

The software supports up to 8 serial ports and remote network ports are supported. It can support modems or direct links to level converters. There is no limit to the number of meters or number of sites that can be supported. The software can also be configured to read specific registers from the meters. In summary, meter readings can be imported into spread sheets or other energy management software.

PC Specifications: P4 or greater, running MS Windows XP or later, Min 64MB RAM, min 2MB free disc space, min 1 free serial port.
